Emergency Communications:  
The Emergency Alert System (EAS) and  
All-Hazard Warnings

Updated July 17, 2006

Linda K. Moore  
Analyst in Telecommunications Policy  
Resources, Science, and Industry Division
Summary

The Emergency Alert System (EAS) is built on a structure conceived in the 1950’s when over-the-air broadcasting was the best-available technology for widely disseminating emergency alerts. It is one of several federally managed warning systems. The Federal Emergency Management Agency (FEMA) jointly administers EAS with the Federal Communications Commission (FCC), in cooperation with the National Weather Service (NWS), an organization within the National Oceanic and Atmospheric Administration (NOAA). The NOAA/NWS weather radio system has been upgraded to an all-hazard warning capability. Measures to improve the NOAA network and the broader-based EAS are underway or are being tested.

The Intelligence Reform and Terrorism Prevention Act (P.L. 108-458) addressed the possibility of using advanced telecommunications and Internet technologies for emergency notification by requiring the Department of Homeland Security (DHS) to implement pilot projects. On June 26, 2006, President George W. Bush issued an executive order stating that U.S. policy is “to have an effective, reliable, integrated, flexible, and comprehensive system to alert and warn the American people.” To achieve this policy, the President sets out a list of functional requirements for the Secretary of Homeland Security to meet.

Bills in the 109th Congress that would improve emergency alert systems, domestically and internationally, include S. 50 (Senator Inouye) and H.R. 396 (Representative Menendez); these bills were prompted by the tsunami disaster but include measures that also apply to the need for a better all-hazard warning system in the United States. A bill dealing more broadly with the development of emergency alert networks and post-disaster communications has been introduced by Senator Jim DeMint (S. 1753). It has been approved by committee, with amendments that include the incorporation of S. 50. Bills similar to S. 1753, but with some modifications and without the text from S. 50, were introduced in the House by Representative John Shimkus (H.R. 5556, amended as H.R. 5785). A bill to provide telephonic alerts as part of a national alert system has been introduced (H.R. 2101, Representative Meek). A bill to assist individuals with disabilities in emergency situations (S. 2124, Senator Harkin) includes provisions for providing information in emergencies. A companion bill to S. 2124 was introduced by Representative James R. Langevin (H.R. 4704). H.R. 5351 (Representative Reichert), a bill which would strengthen FEMA within the Department of Homeland Security, includes a section covering general provisions for an “Integrated National Alert and Warning System.” H.R. 5759 (Representative Harris) has similar provisions regarding an integrated national alert system.

This report summarizes the technology and administration of EAS and the NOAA/NWS all-hazard network, new programs in DHS, and some of the key proposals for change. It will be updated.

Emergency Communications:
The Emergency Alert System (EAS) and All-Hazard Warnings

The two mainstays of the U.S. capacity to issue warnings are the Emergency Alert System (EAS), which relies primarily on broadcasting media, and the NOAA Weather Radio All-Hazards Network. The National Weather Service (NWS) of the National Oceanic and Atmospheric Administration (NOAA)\(^1\) sends alerts through NOAA Weather Radio (NWR), now expanded to include warnings for all hazards. Several initiatives are underway within the federal government to improve, expand, and integrate existing warning systems. The most important of these — in terms of using, testing and developing leading-edge technology — is the Integrated Public Alert and Warning System (IPAWS), a public-private partnership in which the Department of Homeland Security (DHS) has a leadership role. Many communities, meanwhile, are installing local alert systems that send voice, text messages, and e-mail. Locally activated alert systems are widely used Amber Alerts.\(^2\) Amber Alert systems are in place nationwide to aid primarily in the recovery of abducted children.\(^3\) Amber Alerts are currently supported by a number of different technologies, including a quasi-national network based on the Internet. Amber Alert messages also can be sent through the Emergency Alert System and the NOAA Weather Radio All-Hazards Network. Many agree that the long-term goal for emergency alerts is to converge federal warning systems into an integrated network that can interface with localized warning systems and also call centers, such as those used for 911 and 211 calls.\(^4\)

The 9/11 Commission Report discusses the effectiveness of emergency alerts at the World Trade Center on September 11, 2001, with a focus on communications

4 911 calls go to Public Safety Answering Points (PSAPs). 211 calls typically go to municipal call centers. The role of call centers in providing warnings and information in emergencies is discussed in CRS Report RL32939, An Emergency Communications Safety Net: Integrating 911 and Other Services, by Linda K. Moore.
systems.\textsuperscript{5} Recent, major studies of warning systems have concluded that the United States needs a more robust emergency alert system. Recommendations for improvement include using all available means of communication, providing a standardized alert protocol, and developing infrastructure for notification to geographically specific locations and virtual communities.\textsuperscript{6} A virtual community in the context of emergency communications refers to the technical ability to give immediate, simultaneous alerts to the appropriate community of responders and affected residents. Before its towers collapsed, the World Trade Center’s occupants might have benefitted if virtual community or geo-targeted alert technology had been in place and activated.

EAS Administration

EAS currently sends emergency messages with the cooperation of broadcast radio and television and most cable television stations. It was created as CONELRAD (Control of Electromagnetic Radiation) in 1951, as part of America’s response to the threat of nuclear attack. In 1963, the system was opened to state and local participation. Through most of its existence, the alert system was known as the Emergency Broadcast System. The name was changed in the 1990’s when the technology was upgraded and automated.

Congress has placed responsibility for civil defense measures that include the present-day EAS with the Director of the Federal Emergency Management Agency (FEMA)\textsuperscript{7} now part of the Department of Homeland Security (DHS). The Federal Communications Commission (FCC) has been designated by FEMA to manage broadcaster involvement in EAS. The FCC currently provides technical standards and support for EAS, rules for its operation, and enforcement within the broadcasting and cable industries. FEMA works with the emergency response officials who, typically, initiate an EAS message for a state or local emergency. Non-federal EAS operational plans are developed primarily at the state and local level, often with the participation of FEMA and other federal agencies. The FCC provides rules and guidelines for state EAS plans and many, but not all, states have filed FCC-compliant EAS plans. FEMA advisors often help to integrate EAS usage into emergency alert plans. The decentralized process contributes to uneven planning; for example, procedures for initiating a message and activating EAS differ from state to state. In comments filed with the FCC, DHS has proposed that FEMA and DHS “should be the primary point of contact” and act as the “Executive Agent” in managing alerts.

\textsuperscript{6} These recommendations, and others, were affirmed at a Senate Hearing,”All-Hazards Alert Systems,”’ Committee on Commerce, Science and Transportation, Subcommittee on Disaster Prevention and Prediction, July 27, 2005.

and warning information. The FCC would continue its regulatory role for broadcasting and wireless communications.\(^8\)

Umbrella organizations that participate in EAS planning and administration include the Media Security and Reliability Council (an FCC Advisory Committee), the Primary Entry Point\(^9\) Advisory Committee, and associations such as the National Association of Broadcasters and state broadcasting associations. States and localities organize Emergency Communications Committees whose members often include representatives from broadcasting companies or local TV and radio stations. These committees agree on the chain-of-command and other procedures for activating an emergency message through radio and television. The constraints of the EAS technology, as specified by the FCC, limit an EAS message to no more than two minutes. Emergency alert agreements with broadcasters, therefore, usually provide for both EAS warning messages and follow-up broadcast programming.

**Broadcaster Participation.** The participation of broadcast and cable stations in state and local emergency announcements is voluntary. The FCC has designated over 30 radio stations as National Primary Stations that are required to transmit Presidentially initiated alerts and messages. Their broadcasts are relayed by Primary Entry Point stations to radio and television stations that rebroadcast the message to other broadcast and cable stations until all stations have been alerted.

The FCC requires broadcast and cable stations to install FCC-certified EAS equipment as a condition of licensing. Radio and television broadcast stations, cable companies and wireless cable companies must participate. Cable companies serving communities of less than 5,000 may be partially exempted from EAS requirements. For the broadcast of non-federal emergency messages, the FCC has ruled that the broadcasters, not a state or local authority, have the final authority to transmit a message.\(^10\) Historically, the level of cooperation from the broadcasting industry has been high. For example, because state and local governments are not required to upgrade to EAS-compatible equipment — and therefore may lack direct access to the technology — broadcasters often volunteer to manage the task of EAS message initiation.

**Digital Broadcasting.** The FCC has promulgated new rules to include digital media carriage of EAS messages. In a Report and Order released November 10, 2005, EAS requirements have been expanded to include digital communications over direct-broadcast television and radio, digital cable, and direct-to-home satellite television and radio. Companies using these media will be required to install EAS

---

\(^9\) The Primary Entry Point (PEP) system consists of a nationwide network of broadcast stations connected with government activation points through designated National Primary Stations.

equipment to handle digital formats. As part of the Report and Order, the FCC has also asked for a new round of comments on ways to improve and expand the current emergency alert system.11

**EAS Technology.** EAS technology uses coders and decoders to send data signals recognized as emergency messages. Almost any communications device can be programmed to receive and decode an EAS message. In manual mode, an EAS alert is sent to a broadcaster, either over an EAS encoder-decoder or by other means, such as a telephone call. Where agreements have been put in place with broadcasters, EAS messages can be created and activated by state or local officials and transmitted automatically to the public without the intervention of broadcasting staff. These messages use computer-generated voices. All EAS messages carry a unique code which can be matched to codes embedded in transmitting equipment; this authenticates the sender of the EAS message. To facilitate the transmittal of emergency messages, messages are classified by types of events, which also are coded. These event codes speed the recognition and re-transmittal process at broadcast stations. For example, a tornado warning is TOR, evacuation immediate is EVI, a civil emergency message is CEM. When a message is received at the broadcast station, it can be relayed to the public either as a program interruption or, for television, as a “crawl” at the bottom of the TV screen. The installed technology limits messages to two minutes; emergency managers and station operators have prescribed message templates that have been timed to fit this constraint; specific information is added to the text at the time of the emergency. When new event codes are added, broadcasters must upgrade their equipment to recognize the codes. To use EAS in a more flexible manner, with messages longer than two minutes, for example, also would require broadcasters to upgrade existing equipment.

**Alerting Individuals with Disabilities and Others with Special Needs.** The FCC requires that EAS messages be delivered in both audio and visual (captions, message boards, other) formats. Regular broadcasts about emergencies, however, do not have to comply with this requirement. The community of disabled individuals, therefore, is often under-served when emergency information is disseminated outside the EAS network. Although a number of technologies exist to provide accessible formats for people with special needs — such as those with disabilities, the elderly, and those who do not understand English — many of these solutions are not supported by the current EAS system or are so expensive as to be inaccessible to most. Incorporating technologies that expand the reach of EAS, at a reasonable cost, is one of the challenges of delivering an effective warning system that is truly nationwide.12

---

NOAA Weather Radio

Digitized signal technology for EAS is the same as that used for the NOAA Weather Radio (NWR). Widely recognized as the backbone of public warning systems, NWR broadcasts National Weather Service forecasts and all-hazard warnings for natural and man-made events. The compatibility of the signals makes it possible for EAS equipment used by the media to receive and decode NWR messages automatically. Weather radios can be tuned directly to NWR channels. Many can be programmed to receive only specific types of messages — for example, civil emergency — and for specific locations, using Special Area Message Encoding (SAME). Weather radios can sound an alarm or set off a flashing light. Similar technology is available to provide NWR messages by satellite TV and over the Internet as messages or as e-mail. The weather radios available to the public to receive NWR alerts are equipped to receive any EAS message. In reality, broadcast and cable stations rarely program their EAS technology to transmit voluntary state or local messages over the NWR channels. NOAA has improved, and continues to upgrade, its technology to support an all-hazard warning system. It is encouraging public safety officials to notify them as well as their EAS broadcast contacts regarding non-weather-related emergencies so that they may be rebroadcast on NWR. The eventual inclusion of warnings and alerts from the Department of Homeland Security will bolster these efforts.

All-Hazard Warning Technology

Given the advanced state of other communications technologies, especially the Internet and wireless devices, the reliance on delivering EAS warnings by radio and television broadcasting seems out-of-date. Some states and communities are pioneering alert systems that utilize other infrastructures. In particular, many communities participate in programs with e-mail or Internet alerts and some issue mass alerts by telephone. Among the best developed of these warning programs are those used for Amber Alerts, providing noteworthy examples of public-private partnerships. Recently, for example, more than 15 states reportedly have launched or are preparing to launch Internet technology customized for Amber Alerts. It is hoped by its developers that this system might become the backbone for an expanded all-hazards warning system that would extend the reach of emergency alerts to all types of communications media.13

Common Alerting Protocol. A standardized format known as Common Alerting Protocol (CAP)14 has been developed for use in all types of alert messages. CAP has received widespread support from the public safety community and has been accepted as a standard by the international Organization for the Advancement

---

of Structured Information Standards (OASIS). One of its key benefits is that it can be used as a single input to activate multiple warning systems. It is being used as a standard for several tests of new, digitized alert networks using multiple technologies.

**Call Centers.** Some of the technological solutions for disseminating alerts and providing information rely on call centers, including 911 emergency call centers (also referred to as Public Safety Answering Points, or PSAPs). *The 9/11 Commission Report* describes the often inadequate response of 911 call centers serving New York City. The report’s analysis of the 911 response recommends: “In planning for future disasters, it is important to integrate those taking 911 calls into the emergency response team and to involve them in providing up-to-date information and assistance to the public.” Such a solution would require a common infrastructure that would support a number of communications and warning needs. Many recommendations have encouraged the development of greater end-to-end connectivity among all types of emergency services.

**Department of Homeland Security.** In June 2004, the National Oceanic and Atmospheric Administration (NOAA) and the Department of Homeland Security’s Information Analysis and Infrastructure Protection Directorate signed an agreement that allows DHS to send critical all-hazards alerts and warnings, including those related to terrorism, directly through the NOAA Weather Radio All-Hazards Network. Under the agreement, DHS will develop warning and alert messages that will be sent to NWR for broadcast to radios and other communications devices equipped with SAME technology.

**Digital Emergency Alert System.** Working with the Association of Public Television Stations, DHS completed two successful pilots to test the implementation of digital technologies and networks, the Digital Emergency Alert System (DEAS). It has been announced that DEAS capabilities will be installed in all Public Television stations by year-end 2007. DEAS uses the additional capacity that digital technology provides for broadcasting to send digitized alerts to almost any communications device, including wireless. The rollout is part of the Integrated Public Alert and Warning System (IPAWS). It is a joint effort of FEMA, the Information Analysis and Infrastructure Protection directorate at DHS, and the Association of Public Television Stations (APTS). It is testing digital media — including digital TV — to send emergency alert data over telephone, cable, wireless

---

17 Ibid., p. 318.

devices, broadcast media and other networks. If successful, the program will provide
the base for a national federal public safety alert and warning system using digital
technology.\footnote{Testimony of John M. Lawson, President and CEO, Association of Public Television Stations, \textquotedblleft Senate Hearing, July 27, 2005.} The first phase of the program successfully tested the use of common
standards for message formats and interfaces using CAP.

Another joint program under the IPAWS umbrella is a pilot with NOAA to test
a geo-targeted alert system using “reverse 911.” Reverse 911 is a term sometime
used to describe any calling system that places calls generated by a public safety call
center to a specific audience.

A program component of IPAWS is to improve the robustness of the
communications network to Primary Entry Point (PEP) radio stations by switching
from dial-up to satellite distribution. The number of PEP broadcast stations is to be
expanded to provide satellite communications capability to every state and territory.
These steps are meant to assure the survivability of radio broadcast communications
in the event of a catastrophic incident.\footnote{Testimony of Reynold N. Hoover, Director, Office of National Security Coordination, FEMA, Department of Homeland Security, Senate Hearing, July 27, 2005.}

\textbf{Other Technology Initiatives.} Among other methods being tested to
expand broadcast capabilities for emergency alerts are equipping cell phones with
and using cell phone broadcasting technology. Datacasting is a one-way broadcast
transmission using Internet Protocols.\footnote{Testimony of John M. Lawson, Senate Hearing, July 27, 2005.} The broadcasts can carry voice and data,
including videos, graphics, and text messages. In the Digital Alert Emergency
System pilot, mentioned above, datacasting is being broadcast to digital televisions
and antennae linked to computer networks or directly to computers and laptops.
Reportedly, commercial wireless providers that participated in the pilots have not
committed to participating in DEAS because of questions about capabilities for
delivering alerts as text messages.\footnote{“DHS Funds National Rollout of Public TV Digital EAS,” Communications Daily, July 13, 2006.} Some advanced wireless phones and other
portable devices can receive digital TV broadcasts, however.

Some countries are advocating the use of cell broadcasting to send alerts to cell
phones based on location. The Netherlands, for example, requires cell operators to
transmit government warnings with cell broadcasts of text messages. The national
weather service will use it to send alerts. The Dutch government paid three wireless
service operators a total of $3 million to equip their networks for cellular networks.\footnote{“Mobile Providers Resisting SOS Alerts,” by Kevin J. O’Brien, International Herald
Tribune, January 11, 2006, page 1. For further information on cell broadcasting, one source (continued...)}
In the United States, which has a variety of wireless phone technologies in use, cell broadcasting has limited applications, as it works on two standards only: GSM and CDMA, and their successor architectures. The GSM standard, and its successor standards, is the authorized standard in the European Union.

Satellite radio could also become part of the new era of digital signal alert systems. XM Satellite Radio will broadcast emergency alerts to the D.C. region through a link with the alert system of Arlington County, Virginia. The Arlington Alert network is operated by Roam Secure, Inc, a company that provides text message alert systems to corporations and some governments, including Arlington and Fairfax Counties in Virginia and the District of Columbia. XM Satellite Radio is also a participant in the IPAWS Digital Emergency Alert System pilot.

Proposals and Progress

Advocates of all-hazard warning systems are seeking interoperability among warning systems, standardized terminology, and operating procedures in order to provide emergency alerts and information that reach the right people, in a timely manner, in a way that is meaningful and understood by all. In 1999, FEMA and the Departments of Commerce and Agriculture took the lead in a multi-agency working group to explore ways to create an all-hazard warning network. Their recommendations included using NWR as the backbone for a national all-hazard warning system and the establishment of a permanent group to promote improvements in warning systems. The following year, the National Science and Technology Council at the White House sponsored a report that explored the types of technologies and systems that are used or could be used for emergency alerts. Among its recommendations were: the creation of a public-private partnership that would bring all stakeholders together; one or more working groups to address issues such as terminology, technology, location-specific identifiers and cost-effective warning systems; system standardization; and increasing the number of communications channels for warnings. The report concluded that substantial improvements in early warning systems could be achieved through coordination and better use of existing technologies.

---

25 (...continued)

Also in 2000, a public-private, multi-disciplinary group was organized as the Partnership for Public Warning (PPW). In 2002, the group received funding\(^{29}\) to convene meetings and prepare comments regarding the Homeland Security Advisory System (HSAS). Workshop findings were later expanded into recommendations in “A National Strategy for Integrated Public Warning Policy and Capability.” The purpose of the document was to “develop a national vision and goals” for improving all-hazard warning systems at the federal, state and local levels. PPW suggested that DHS take the lead in developing a national public warning capability. The PPW discussed the role of an alert system in public safety and homeland security and concluded that current procedures are “ineffective.” PPW’s recommendations centered on developing multiple, redundant systems using various technologies with common standards that would be “backward compatible” with EAS (including Amber Alert codes) and National Weather Service technologies. In June 2004, PPW published an overview of emergency alert and warning systems.\(^{30}\) It subsequently scaled back its activities for lack of funding.\(^{31}\)

**Executive Order: Public Alert and Warning System**

On June 26, 2006, President George W. Bush issued an executive order stating that U.S. policy is “to have an effective, reliable, integrated, flexible, and comprehensive system to alert and warn the American people. . . .” To achieve this policy, the President sets out a list of functional requirements for the Secretary of Homeland Security to meet, that respond to the recommendations of experts in this field. In summary, these requirements cover

- evaluating existing resources;
- adopting common protocols, standards and other procedures to enable interoperability;
- delivering alerts on criteria such as location or risk;
- accommodating disabilities and language needs;
- supporting necessary communications facilities;
- conducting training, test, and exercises;
- ensuring public education about emergency warnings;
- coordinating and cooperating with the private sector and government at all levels;
- administering the existing Emergency Alert System as a component of the broader system;
- ensuring that the President can alert and warn the American people.

The order also specifies the level of support expected from other departments and agencies in meeting the requirements for a better warning system. The Secretary

\(^{29}\) Funding came from FEMA, the National Science Foundation, the National Weather Service, the U.S. Geological Survey, and private sources.

\(^{31}\) Memorandum to PPW Members, June 30, 2004.
of Homeland Security is further ordered to “ensure an orderly and effective transition” from current capabilities to the system described by executive order.  

e**Recent Legislation**

The Intelligence Reform and Terrorism Prevention Act (P.L. 108-458) has requirements for a study about the use of telecommunications networks as part of an all-hazards warning system. The study is to be led by the Secretary of Homeland Security, in consultation with other Federal agencies, as appropriate, and participants in the telecommunications industry. Its goals are to consider the practicality of establishing a telecommunications-based warning system that would also provide information to individuals on safety measures that might be taken in response to the warning. The legislation specifies that technologies to consider would be “telephone, wireless communications, and other existing communications networks . . .” The act also requires a pilot study using technology now being used for an Amber Alert network, to improve public warning systems regarding threats to homeland security. This is to be conducted by the Secretary of Homeland Security in consultation with the Attorney General, other federal agencies, the National Association of State Chief Information Officers, and other stakeholders in public safety systems. These pilots are being coordinated through FEMA’s Office of National Security Coordination as part of the IPAWS program. An interim report was provided to Congressional committees in March 2006.

e**Emergency Alerts and the 109th Congress**

There are several parts to a warning system: detection of a problem; communication of the danger to a warning system; dissemination of the warning through communications networks; and information about actions to take in response to the warning, or in the aftermath of disaster. In a natural disaster where there is good predictive capability, such as a hurricane, emergency alerts work fairly well. In a man-made disaster, such as a terrorist attack or a chemical spill, the current warning systems in the United States are vulnerable to failure. Too often, the warning is not communicated to any alert system. Communication with people most in need of information and assistance after a disaster is constrained by inadequate systems.

---

33 Study Regarding Nationwide Emergency Notification System, Intelligence Reform and Terrorism Prevention Act, Title VII, Sec. 7403.

34 Pilot Study to Move Warning Systems Into the Modern Digital Age, Intelligence Reform and Terrorism Prevention Act, Title VII, Sec. 7404.

and often complicated by damage to communications infrastructure. Due to insufficient planning and preparation, there is often confusion about responsibility, priorities, and needed actions. Some observers have noted that the most effective emergency alerts would be able to empower the “first” first responders, those on the site of the disaster when it occurs. Many have emphasized the need for better oversight and planning for an all-hazard warning system. Experts in public safety and communications have observed that it is both possible and desirable to coordinate the development of information networking technology for various types of emergency responses, maximizing the reach of any warning or alert.

**Improving Emergency Alert Systems.** The National Emergency Reform and Enhancement Act (H.R. 5351, Representative Reichert) is one of several bills in Congress that would change the management structure for the Federal Emergency Management Agency. It would create a Directorate of Emergency Management with responsibilities that include providing “an integrated national public alert and warning system that incorporates legacy systems.” Among the requirements for the alert system are interoperability with existing alert and warning systems at all levels of government, improved education for the public, use of technology to overcome barriers caused by disabilities or language barriers, development of public-private partnerships, and the use of new technologies, including satellite.

Representative Katherine Harris has introduced H.R. 5759, the Foundations for Emergency Management (FEMA) Act, which includes sections on interoperability and emergency alerts similar to provisions in Representative Reichert’s bill.

Versions of the WARN Act (Warnings, Alerts, and Response Network) have been introduced in the Senate (S. 1753, Senator DeMint) and the House (H.R. 5556, amended as H.R. 5785, Representative Shimkus). All would support the efforts of the Department of Homeland Security, NOAA, and others, as described in this report. Some provisions in both bills would change the existing lines of authority in the planning and administration of emergency alerts. Today, responsibility for the Emergency Alert System is shared between FEMA, the lead authority, and the FCC, responsible for regulating emergency alert compliance among broadcasters and others under its jurisdiction. The role of the FCC as a regulatory body, with limitations, is confirmed in the proposed legislation. The main responsibility for developing and administering a nationwide alert system would be placed with a National Program Office established within NOAA. The bills would also establish a Working Group on the National Alert System. The chief purpose of the group — to be comprised of representatives from federal, state and local agencies, emergency services, and industry — would be to develop a plan for a national system, with technical and other guidelines. The director of the National Program Office would form the Working Group and act as its chair. Other responsibilities of the Director include implementing the Working Group’s recommendations, setting up and conducting a program of research and development, and managing the credentialing of public officials who would be authorized to initiate alerts. This step would federalize the procedures for designating those public officials that would be authorized to request an emergency alert. The National Program Office would process requests for

---

37 H.R. 5351, Title V, ‘Sec. 568.’
credentialing at the federal, state, and local level. The office would also be required to monitor activity to assure that warnings were sent only by appropriately authorized agents. These agents would be required to undergo periodic training in programs established by the office. Overall, the National Program Office would be required to establish a system that took advantage of all available technologies, both in providing access points to issue warnings and in sending and receiving alerts and information. The bills would require mobile service operators to either provide emergency alert messages or specifically opt out of providing such a service.

Other measures proposed in both bills include extending the authority to require emergency alerts to state governors and the Secretary of Homeland Security, as well as the President. Currently, only the President of the United States, or his designate, has the power to require an emergency alert, a power that has never been used. In all non-federal cases, as noted in the body of this report, the emergency alert system of notification is voluntary.

S. 1753 also would set up a grant program to provide alert systems in remote communities that are “effectively unserved” by broadcast and wireless technology. As amended in committee, the bill incorporates S. 50 (see below). Funding for programs would be provided through the Digital Transition and Public Safety Fund. This fund is to be created as part of the budget reconciliation process (P.L. 109-171) and administered by the NTIA. One provision in the bill authorizes payments of up to up to $106 million to implement a unified national alert system and $50 million for a tsunami warning and coastal vulnerability program. Provisions in the Senate bill that do not appear in the House bill include the creation (and funding) of programs for alert systems in remote communities and for public outreach. The Congressional Budget Office has estimated that $10 million will be paid from the fund in 2009, followed by payments of $73 million in both FY2010 and FY2011.

H.R. 5785 specifies that the National Alert System would be voluntary. The bill specifies that funding for the act would come from the Digital Transition and Public Safety Fund and authorizes the NTIA to borrow up to $106 million against future proceeds of the Fund. A section in H.R. 5556 (June 8, 2006) that deals with limitations on liability is omitted in H.R. 5785 (July 13, 2006).

**Tsunami Warnings.** The horrific devastation across the Indian Ocean from the tsunami of December 26, 2004 raised the level of awareness to the need for better systems for detection and warning, as well as the associated steps for preparedness and response. The Administration has announced plans to expand the U.S. tsunami detection and warning capabilities as a contribution of the Global Earth Observation System of Systems, or GEOSS — the international effort to develop a comprehensive, sustained and integrated Earth observation system. The plan commits

38 Conference Report, H.Rept. 109-362, Title III, Sec. 3004 (3) “(E) “(I) and (ii).
39 Conference Report, H.Rept. 109-362, Title III, Sec. 3010.
41 H.R. 5556, Sec. 3 (g).
Congressional bills that have measures to improve all-hazard warning systems in the United States include S. 50 (Senator Inouye) and H.R. 396 (Representative Menendez). These two bills provide different perspectives on emergency alert planning, activation, and response but they both recognize the need for aggressively advancing the development and deployment of warning systems. S. 34 (Senator Lieberman) would strengthen tsunami detection and warning systems worldwide but focuses on detection and communications among authorities and does not include provisions specifically for improving emergency alerts to the general populace.

**S. 50.** The Tsunami Preparedness Act (Senator Inouye) builds on the Administration’s plan for an improved tsunami monitoring system. Additionally, the bill would improve federal coordination and would establish a task force of representatives of federal agencies, coastal states and territories. The bill directs the Administrator of NOAA to maximize the effectiveness of detection and warning systems for U.S. coastal communities and to take actions to assist other countries in achieving similar goals. The main purposes of the bill are

- Improve tsunami detection, forecast, warnings, notification, preparedness, and mitigation.
- Extend coverage of existing Pacific Tsunami Warning System to include other vulnerable areas such as the Caribbean, Atlantic Coast and the Gulf of Mexico.
- Increase efforts to improve forecasting, preparedness, mitigation, response and recovery, including education and outreach.
- Provide technical and other assistance to international efforts.
- Improve federal, state, and international coordination for tsunami and other coastal hazard warnings and preparedness.

System components covered in the bill include a number of provisions for detection and information sharing and require a communications infrastructure to alert communities vulnerable to the occurrence of a tsunami. Program components include outreach, education, preparedness and risk management. The bill authorizes a tsunami research program that includes communications technology. The NOAA Administrator, in consultation with the Assistant Secretary of Commerce for Communications and Information and the Federal Communications Commission, is to investigate the potential for improved communications systems for hazard warning networks. Technologies mentioned include telephones, cell phones and other wireless devices, satellite communications, the Internet, automated alerts on television and radio, and technologies that might be suitable for reaching remote areas at a low cost. Provisions for assistance on a global level include technical assistance to international organizations in developing a global tsunami warning system.

system. Also, the NOAA Administrator is to give priority in assisting vulnerable areas with needs such as planning, obtaining detection and reporting equipment, and establishing communications and warning units. This bill has been incorporated in S. 1753.

**H.R. 396.** The Early Warning and Rapid Notification Act (Representative Menendez) provides for the establishment of U.S. programs lead primarily by the Department of State and the United States Agency for International Development (USAID),\(^{45}\) to give technological and financial support to foreign countries for the development of all-hazard warning systems, and to strengthen existing lines of communication for the dissemination of information on disasters. The bill centers on early warning systems, the work of organizations such as the International Early Warning Program,\(^ {46}\) and the contributions of USAID to international detection and warning programs. The Secretary of State is to lead a study that would evaluate the effectiveness of existing communications links and ways to improve them. The bill provides for assistance, through the Department of State and USAID, for international programs that enhance effective public warning systems. The bill would also expand the scope of American research on public warning systems by providing for sharing results, where appropriate, with the international community. Specifically, it would broaden the scope of the Study Regarding Nationwide Emergency Notification System and the Pilot Study to Move Warning Systems Into the Modern Digital Age — required by the Intelligence Reform and Terrorism Prevention Act — to include a component for evaluating the applicability of various alert technologies to other countries. The Secretary of State, cooperating with the Department of Homeland Security, the Federal Communications Commission and the Assistant Secretary of Commerce for Communications and Information (Administrator of the National Telecommunications and Information Administration), among others, is to lead these research activities. Other responsibilities involve the study of evolving technologies that could be used in providing all-hazard warnings in the United States and abroad.\(^ {47}\) The named agencies are also to study the role of satellites, wireless technology and radio frequency assignments in providing emergency alerts, working with the World Radio Conference\(^ {48}\) and other international forums.

**Tsunami Detection.** The Global Tsunami Detection and Warning System Act (S. 34, Senator Lieberman) deals almost exclusively with provisions for

---

\(^{45}\) USAID is an independent federal government agency that receives overall foreign policy guidance from the Secretary of State. It provides economic and humanitarian assistance in over 100 countries [http://www.usaid.gov/].

\(^{46}\) The International Early Warning Program, which has been planned for two years, is to be created by the United Nations to increase international cooperation in the development of warning systems and related programs.

\(^{47}\) Specific technologies mentioned are “broadcast media, wireline and wireless telephones, other wireless devices, instant messaging via computer, and electronic bulletin boards.”

\(^{48}\) The World Radio Conference is the forum for the negotiation of international agreements that coordinate and enable global telecommunications. It is held under the aegis of the International Telecommunication Union (ITU), a specialized agency of the United Nations.
improving detection of tsunamis and the earthquakes that generate them. Programs that would include identifying deficiencies in existing systems worldwide, increasing the number of sensors for detecting tsunamis, and improving predictive capabilities and communications infrastructure would be the responsibility of the Secretary of Commerce, working with the Secretaries of State and of the Interior, where appropriate. The bill provides the sense of Congress that the President of the United States should convene an international conference on global tsunami detection and warning. The Secretary of State, working with the Secretary of Commerce, is to prepare and implement a strategy that would provide for a global network for detection and warning for tsunamis. This strategy is to include a “warning communications system involving telephone, Internet, radio, fax, and other appropriate means to convey warnings as rapidly as possible to all potentially affected nations.”

**Other Bills.** A bill comparable to S. 34 has been submitted in the House (H.R. 499, Representative Shays). Other bills include S. 361 (Senator Snowe); S. 452 (Senator Corzine); H.R. 882 (Representative Boehlert); H.R. 890 (Representative Pallone); H.R. 1584 (Representative Weldon); and H.R. 1674 (Representative Boehlert) — are concerned with tsunami detection and the initial stages of notification.

**Telephonic Alerts.** Representative Kendrick B. Meek has introduced a bill (H.R. 2101) that would require the deployment of a national alert system using “to the maximum extent possible . . . national private sector networks, technology, personnel, and infrastructure to develop and implement the system.” The network, referred to as the REALICall emergency alert system, would provide a federal network of notification by telephone, based on geographic location, to alert telephone subscribers of disasters and inform them of steps to be taken in response.

**Alerting Individuals with Disabilities.** The Emergency Preparedness and Response for Individuals with Disabilities Act (S. 2124, Senator Harkin) and its companion bill (H.R. 4704, Representative Langevin) would amend the Homeland Security Act (36 USC 316) to require the Secretary of Homeland Security to appoint a Disability Coordinator “to ensure that the needs of individuals with disabilities are being properly addressed in emergency preparedness and disaster relief.” Among the duties specified for the coordinator to assist individuals with disabilities are: ensuring the accessibility of telephone hotlines and websites with information on emergencies; and working with the FCC to assure that distribution channels for video programming (TV broadcasters and others) make emergency information accessible to those with hearing or vision disabilities.
Other Federal Emergency Warning Systems

Federal agencies administer numerous emergency notification systems. Briefly noted below are other warning systems that are used to warn the public and authorities.

National Warning System (NAWAS). In 1957, the National Warning System (NAWAS) was established. NAWAS, still in use as an operational warning system, is a dedicated telephone network that FEMA administers and uses to coordinate with national, regional, state, and local emergency management officials. Today the system connects over 22,000 national, regional, state and local emergency management offices. NAWAS disseminates emergency information and instructions.

Federal Emergency Management System (FEMIS). FEMIS is an independent network of different communication devices that operate over various media (microwave, fiber optics, and wireline). The U.S. Army installs and operates the system and notifies state and local emergency management officials in the vicinity of chemical and biological weapon stockpiles designated for destruction of accidental, terrorist, or criminal release of the chemical and biological weapon stockpiles. The system provides digital image files of the contaminated geographical area.

Homeland Security Advisory System (HSAS). HSAS, the system most recently established in response to the terrorist attacks of September 11, 2001, provides a color coded terrorist attack warning system to federal, state, and local authorities, as well as the public. At this date, Office of Homeland Security (OHS) manages HSAS, with guidance from the U.S. Attorney General. Daily advisories are posted on the Internet, and the Attorney General notifies the federal, state and local authorities of any change to the advisory color code. Public warnings, resulting in

a change to the color code, are issued through statements made by the OHS through the media.\textsuperscript{56}

**Advanced Weather Information Processing System.**\textsuperscript{57} AWIPS is a telephone network administered by the Weather Forecast Office (WFO), which is part of NWS. This network is a dial-up telecommunications link, also accessible by an Intranet server, that provides for two-way exchange of severe weather information between the weather tracking and news industry and NWS.\textsuperscript{58} This system is used primarily by the NWS to inform the weather tracking and news industry of severe weather, which is then reported to the public through the news media.\textsuperscript{59}

**Emergency Managers Weather Information Network (EMWIN).**\textsuperscript{60} EMWIN is a satellite communications network operated by NWS. EMWIN broadcasts severe weather information to a commercially marketed 1610mHz radio that provides weather warnings to the public and emergency management officials.\textsuperscript{61}

**NOAA Weather Wire Service (NWWS).**\textsuperscript{62} NWWS is operated by NWS and transmits severe weather information to mass news disseminators and emergency management officials. The severe weather information is transmitted by weather satellites and then broadcasted to the public via NWR or EAS.\textsuperscript{63}

The systems briefly described in Table 1, below, are intended to warn the public, federal officials, state and local authorities, or the weather tracking and news industry, of imminent danger to public health and safety.\textsuperscript{64}
